betfair futebol virtual

so I am a complete excel and math noob and I want to have a cell in excel which will 1 display the "Pelayo number", which is used in calculating bias in a roulette wheel. You can read more about it 1 here:

//roulette-bet/2024/06/the-roulette-bias-winning-method.html

enter image

description here

Let me explain briefly what I want. As you can see on the image there are 1 two columns, in one there are the numbers on a roulette wheel and and in the second one there is 1 the frequency of each number. On top you see number of spins (852). The number on the bottom (23,02.....) is 1 the expected frequency of each number. The table is dynamic, constantly evolving as I enter new data.

Now I want a 1 cell to display the total number of positives. Which is calculated like this:

If there have been 300 spins,

each numbers 1 has to have been spun $300/36 = 8.33$ in order to be breaking even. This means those which have been 1 spun 8 times are losing a little, and those which have showed 9 times are winning something. If a number 1 has appeared 14 times it is clear it has $14 - 8.33 = 5.67$ which we will express in an abbreviated form 1 like +5. Let's suppose the exact same situation has occurred for 6 other numbers also, they all will make a 1 total sum of $5.67 + 5.67 + 5.67 + 5.67 + 5.67 + 5.67 + 5.67 = 39.69$. as no other 1 number has been spun over 9 times, then we say the amount of total positives at this table at 300 1 spins is +39.

TLDR So ideally something like: Select all the numbers from (G6:G42)

which are bigger than value in (G50) 1 and then subtract them one after another from the expected frequency (G50) and then add this all up.

I tried to 1 solve it but just couldnt

find a tutorial anywhere
